Stonewater's M2M Solutions Transform Data into Action

Stonewater provides tools to companies seeking the best communications technologies, software and hardware to get the most out of M2M. We work in a variety of industries and environments to monitor and manage widely dispersed machine assets on a global scale. Microturbines; appliances; environmental monitoring; electricity, gas and water monitoring; freezer systems; health monitoring systems; or any other type of machine and data—Stonewater provides customized solutions to meet all business and technical needs.

- Our gateway's modular interface provides the capability to connect to machines, sensors and controllers.
- Our robust network operation center is scalable and reliable.
- We provide secure and redundant communications between gateways and our network operation center over the Internet.
- We have a proven track record for monitoring and managing widely dispersed machine assets.

- Stonewater's efficient data packet structure provides wireless data transport that is now cost-competitive with wire-based communications.
- Our applications provide flexible grouping and display of measure points for monitoring, as well as notification messages and control signals.
- Our customer interface, accessed through the Internet, allows for a degree of customization unlike any other—you can group and compare sites, and measure points independently. Stonewater applications are capable of displaying environmental parameters, critical system

status and other data from multiple distributed sites on one screen.

- Our near real-time information allows you to make decisions and instantly change operations on a global scale.
- Stonewater's wireless data acquisition and hosted software application require no investment of time and resources on the part of an enterprise IT department.
- The ability to flexibly aggregate data from divergent sources is a powerful management tool for establishing best practices and implementing a complete device management strategy.
